PRODUCT DOCUMENTATION STANDARD

5 core documents per product

Executive summary: keep 1 authoritative home for each fact, with linked contracts and generated views for each audience.

D01	**Solution Brief**	**Communicate value**	Approved positioning, audience, problem, solution, differentiators, maturity and evidence-backed claims.
D02	**Product Master Document**	**Define the product**	Vision, ICP, business model, outcomes, scope, requirements, every screen/state, UX, pricing and roadmap.
D03	**Engineering Specification**	**Define implementation**	Architecture, contracts, data, state machines, AI behavior, security controls, deployment and performance budgets.
D04	**Verification & Release Plan**	**Prove readiness**	Acceptance coverage, evaluations, test strategy, release gates, known limitations and linked evidence.
D05	**Operations & Growth Playbook**	**Run and improve**	Deployment, rollback, support, monitoring, incidents, recovery, launches, experiments and operating costs.

5 logical documents, not a limit of 5 files. Chapters, API contracts, ADRs, issues and evidence are linked records.

PRODUCT DOCUMENTATION STANDARD

The Product Master remains the front door

Create a navigable master entry point. Compile a complete reading edition when needed; maintain each rule only once.

D02 | PRODUCT MASTER

Why, what and experience

Own requirements, acceptance intent, complete journeys, screen states, product metrics, monetization and exclusions. Keep detailed UX as a section or appendix.

D03 | ENGINEERING

How it is implemented

Own architecture and executable contracts. Generate client types from one schema authority. Link to product rules instead of restating them.

Product behavior / pricing / entitlements	**D02**
Visual and interaction rules / all screens	**D02; mockups are linked views**
API / data / event payload definitions	**D03 + canonical contract files**
Quality thresholds / executed evidence	**D04**
Operational procedures / support ownership	**D05**
External claims / product positioning	**D01, derived from D02 + D04**

KPI definition: D02. Instrumentation: D03. Validation: D04. Ongoing results and decisions: D05.

PRODUCT DOCUMENTATION STANDARD

A reusable table of contents

Start lean. Fill the sections needed for the next decision or delivery gate; do not write long documents for their own sake.

D01 | SOLUTION BRIEF

Problem and target customer
Value proposition and differentiators
Key journey and conceptual architecture
Maturity and supported claims
Demo story and next action

D02 | PRODUCT MASTER

Vision, ICP and customer evidence
Goals, outcomes and business model
Scope, requirements and acceptance intent
Journeys, screens, states and design system
Pricing, entitlements and product metrics
Roadmap, assumptions and decisions

D03 | ENGINEERING

System context and deployment
Modules, data model and contracts
Sequences and state machines
Identity, privacy and threat controls
AI/models, retrieval and evaluation hooks
Observability, budgets and dependencies

D04 | VERIFICATION / RELEASE

Risk-based strategy and test matrix
Acceptance + contract + UI tests
AI evaluations and failure scenarios
Privacy, accessibility and security checks
Release criteria and known limitations
Build-specific evidence and sign-off

D05 | OPERATIONS / GROWTH

Deploy, configure and roll back
Monitoring and incident response
Backup, recovery and data lifecycle
Support, ownership and escalation
Launch and distribution checklist
Experimentation, costs and feedback

DOCUMENT CONTROL

Product ID
Owner and approver
Status and approved revision
Last verified build
Authoritative sources and change log

PRODUCT DOCUMENTATION STANDARD

Link intent, implementation and proof

Precision comes from stable identities and automated checks. A forced 1:1 document-to-code mapping would misrepresent shared behavior.

Requirement
Normative source anchor

→

Screen / state
User-visible behavior

→

Contract / module
Owned implementation rule

→

Code / tests
Exact paths and assertions

AWARE CARE EXAMPLE

A05: Adaptive questions

R11-R14 → M04 intake
apps/web/src/screens/A05.tsx
apps/api/app/modules/intake/service.py
tests/ui/A05.spec.ts + R11-R14 acceptance tests

EVIDENCE IS BUILD-SPECIFIC

Planned ≠ implemented ≠ verified

A trace record names source sections, surfaces, modules, code paths, test IDs and the tested build. A passing test from an old build does not verify new behavior.

Automate structural consistency

CI can detect unknown IDs, orphan code, missing coverage and schema drift. It cannot prove that prose or behavior is semantically correct.

Preserve existing IDs. Across products, add a namespace such as aware-care:A05 rather than renumbering the original screen.

PRODUCT DOCUMENTATION STANDARD

Same structure. Different product overlays.

Add applicable sections to the same 5 documents. A new platform or domain does not require a new document family.

SOLARITY MOBILE

Subscriptions + mobile lifecycle

Onboarding, paywalls and entitlements; purchase and restore flows; push permissions; offline behavior; account deletion; distribution and attribution.

WEB APPLICATIONS

Browser + navigation behavior

Responsive breakpoints; route and direct-link guards; browser support; authentication; accessibility; SEO where relevant; deployment and rollback.

HP LOCAL / EDGE AI

Device + execution boundaries

Hardware/runtime compatibility; model provenance; memory and latency budgets; local/external data paths; offline and failure modes; measured benchmarks; demo reset.

HEALTHCARE AI

Intended use + evidence

Supported scope and exclusions; clinical content ownership; urgency escalation; uncertainty; source provenance; provider-data limits; evaluation and review.

These are coverage categories. Consult current platform rules when preparing an actual release.

PRODUCT DOCUMENTATION STANDARD

Turn document changes into controlled delivery

Use issues for work, ADRs for significant choices, and evidence records for observed results. Keep those linked to the 5 documents.

01

Identify affected IDs

Read authoritative sections and the current baseline.

02

Approve changed behavior

Update requirements or contracts before altering scope.

03

Implement the change

Extend the owning module; avoid parallel implementations.

04

Verify and record

Run relevant tests, update evidence and disclose gaps.

MATURITY GATES

Aligned	Ready to build	Ready to demo	Ready to release	Ready to improve
Problem, scope, outcomes	UX, contracts, tests	Working labeled fixtures	Evidence + operations	Metrics + feedback

PRODUCT DOCUMENTATION STANDARD

Adopt without losing the master document

Proposed reorganization only. The existing Aware Care master remains unchanged until its sections are migrated and checked.

EXISTING AWARE CARE BASELINE

Split authority, preserve identities

Keep executive strategy, value, requirements and all screens in D02. Move implementation detail to D03. Put verification strategy and release evidence in D04. Put runbooks and improvement procedures in D05.

COMPLETE READING EDITION

Generate the all-in-one view

A compiled Product Master can include the executive summary, every screen, technical chapters and release links. Mark included chapters with their source revision so the reading copy never becomes a competing authority.

RECOMMENDED REPOSITORY HOMES

docs/	5 documents, index, controlled chapters and decision records
spec/	Requirements, screen registry, contracts and traceability
tests/	Executable acceptance, contract, UI and AI evaluation suites
evidence/	Immutable results tied to commits, builds and releases

Suggested effort: a 1-page brief, lean master/specification, risk-based verification plan and minimum viable runbook. Expand with complexity.

Sources, interpretation and authority

The 5-document structure is a recommendation tailored to your workflow, not a mandated standard.

Aware Care Product Master Document v2.0

Current Library version 1, read 8 October 2026. Atlas sources are listed on each page. It remains authoritative for Aware Care behavior and proposed implementation paths.

Current mock phase and chosen positioning

Conversation decisions: Aware Care name; mock-data prototype first; 1 local HP ZGX; future healthcare edge deployment. The atlas does not assert the target architecture is installed.

C4 model: containers and deployment

https://c4model.com/diagrams/container
https://c4model.com/diagrams/deployment
Used to distinguish software responsibilities from infrastructure placement; diagrams are adapted views, not a full C4 model.

NIST AI Risk Management Framework

https://www.nist.gov/itl/ai-risk-management-framework
https://www.nist.gov/publications/artificial-intelligence-risk-management-framework-generative-artificial-intelligence
Supports lifecycle-oriented AI evaluation and risk management. No certification or conformance claim is made.
